

Name: Md. Abul Moshad Chowdhury

Designation: Head of Application Support & Development

Job Responsibilities

1. OMS Health Monitoring & Maintenance

- Perform regular OMS (Order Management System) health checks.
- Monitor and maintain FIX/ITCH connectivity.
- Ensure OMS system availability and stability.

2. Broker Support

- Provide first-level technical support to brokers during and after trading hours.
- Troubleshoot and resolve trading and system-related issues promptly.

3. Quality Assurance & Release Management

- Test OMS issues, enhancements, and updates before deployment.
- Ensure software quality and system stability.
- Communicate updates and release notes to brokers.
- Escalate critical issues when necessary.

4. Requirement Gathering & Ticket Management

- Collect new requirements from brokers.
- Create and manage Jira tickets for enhancements and issues.
- Provide detailed requirement documentation for Backoffice development.

5. Status Reporting

- Provide regular updates on issue resolution progress.
- Ensure issues are addressed within agreed deadlines.

6. Backoffice Testing & Validation

- Test Backoffice features and functionalities based on development changes.

- Validate system accuracy and performance.

7. Client Onboarding & UAT Support

- Ensure system readiness for onboarding new brokers in UAT.
- Conduct system testing prior to go-live.

8. Client Demonstration & Training

- Provide system demos to new clients.
- Conduct training sessions for broker IT administrators and traders.

9. FIX Certification & Exchange Coordination

- Conduct FIX sessions with DSE for new clients.
- Support clients in obtaining FIX certification.

Access Privileges, Challenges & Required Documentation

1. Existing Privileges

A. OMS (Order Management System)

- Full access to **UAT environment** as *System Admin* (application-level-1 access).
- Limited access to **Production environment** as *Application Support* (application-level-1 access only).

B. Backoffice System

- Same access structure as OMS:
 - Full access in UAT.

2. Key Challenges

A. Reconciliation Delays

- Manual reconciliation using Excel reports is time-consuming.
- Identifying and resolving mismatches in OMS requires excessive manual effort.
- This impacts issue resolution turnaround time.

B. Limited Technical & Infrastructure Access

Currently, the following critical accesses are not available:

- UAT Database access
- UAT Application configuration/settings access
- All service related access (FIX, ITCH, API, Worker etc.)
- Application deployment process visibility
- Client support-related system-level access in UAT
- Conditional Super Admin access (for critical issue investigation) on Production.

Impact of Limited Access:

- Restricted ability to perform deep-dive troubleshooting.
- Delayed root cause analysis.
- Inefficient broker support during critical production issues.
- Increased dependency on development/infrastructure teams.
- Reduced operational visibility in high-priority incidents.

Without conditional Super Admin or system-level diagnostic access, effective troubleshooting becomes constrained.

3. Required/Available Documentation

The following documents are essential for operational efficiency, system understanding, and structured troubleshooting:

A. Database Schema Design

- Table structures
- Relationships
- Key constraints
- Data dictionary

B. OMS Data Flow Diagram

- Order lifecycle flow

- Integration points (FIX/ITCH)
- Exchange communication flow
- Backoffice interaction flow

C. Software Requirements Specification (SRS)

- Functional requirements
- Non-functional requirements
- System behavior

D. User Requirements Specification (URS)

- End-user expectations
- Workflow requirements

E. Business Requirements Specification (BRS)

- Business rules
- Regulatory constraints
- Operational expectations
